

SegDB-2 Source Intensity Distributions After Frozen Preprocessing

(A) CoronaCases
Benchmark Lung-Window Preprocessing
 $[-1250, 250] \rightarrow [0, 1]$

(B) Radiopaedia
Windowed Display Preprocessing
 $[0, 255] \rightarrow [0, 1]$

Distributions are shown separately because CoronaCases and Radiopaedia follow different source-specific intensity preprocessing paths. Values were sampled from source data only; MedSeg target images were not accessed.
