EViCT / VISUAL CT ANALYSIS

RESEARCH ONLY

Evidence-grounded segmentation | Vision-language draft | Selected 2D image

CASE IDENTIFIER

medseg_slice_009_seed42_agreement_filtered_ema

EXAMINATION Selected CT image / no whole-volume evaluation

01 VISUAL EVIDENCE

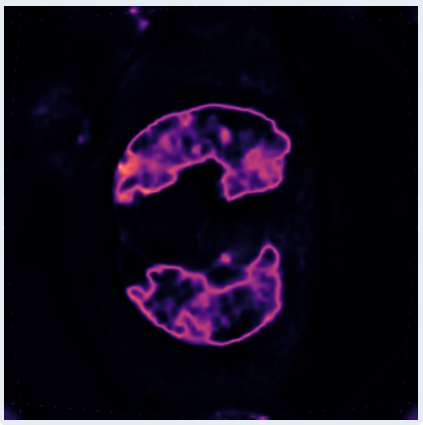

A ORIGINAL CT

B PREDICTED TARGET

C UNCERTAINTY

Warm-color overlay = model prediction; uncertainty is NOT disease probability.
Display contrast normalized for visualization; CT pixel values are not verified Hounsfield units.

MODEL TARGET	SEGMENTED PIXELS	IMAGE-GRID AREA	UNCERTAINTY
DETECTED	25,846	9.86%	0.5549

Pixel extent is descriptive and UNGATED; percentage is of image grid, not lung involvement.

02 FINDINGS / MODEL-DERIVED

A binary target-opacity region is predicted on the selected CT image. The model combines ground-glass opacity and consolidation as one target and cannot separate them.

03 VLM VISUAL DRAFT / NOT CLINICALLY VERIFIED

On this selected CT slice, the lung parenchyma appears to have areas of increased density, potentially indicative of consolidation or fibrosis. The texture within the lung fields shows some irregularities that may require further evaluation for potential pathology.

Screen: terminology_screen_passed_unverified

04 IMPRESSION / RESEARCH CONCLUSION

Model-predicted opacity is present on this image. Etiology and anatomical distribution remain undetermined.

NOT FOR CLINICAL USE

No patient identification, anatomy/laterality, volumetry, diagnosis or independent radiologist review.

Frozen EViCT prediction | New presentation format, not Notebook-11 validated report quality.
